Acta Crystallographica Section E: Structure Reports Online is the IUCr's highly popular open-access structural journal. It provides a simple and easily accessible publication mechanism for the growing number of inorganic, metal-organic and organic crystal structure determinations. The electronic submission, validation, refereeing and publication facilities of the journal ensure very rapid and high-quality publication, whilst key indicators and validation reports provide measures of structural reliability. The journal publishes over 4000 structures per year. The average publication time is less than one month.

Received 24 July 2011; accepted 31 July 2011

Key indicators: single-crystal X-ray study; $T = 200$ K; mean $\sigma(\text{C}-\text{C}) = 0.002$ Å; R factor = 0.032; wR factor = 0.086; data-to-parameter ratio = 13.9.

In the crystal structure of the title compound, $[\text{Mg}(\text{H}_2\text{O})_6] \cdot (\text{C}_7\text{H}_5\text{O}_6\text{S})_2 \cdot 2\text{H}_2\text{O}$, the octahedral complex cation lies on an inversion centre and is hydrogen bonded through the coordinated water molecules to the substituted benzene-sulfonate monoanions and the water molecules of solvation. These interactions together with a carboxylic acid $\text{O}-\text{H} \cdots \text{O}(\text{sulfonate})$ association give a three-dimensional structure.

Hexaaquamagnesium bis(3-carboxy-4-hydroxybenzenesulfonate) dihydrate

G. Smith, U. D. Wermuth and M. L. Williams

Comment

The title compound, $[\text{Mg}(\text{H}_2\text{O})_6]^{2+} 2(\text{C}_7\text{H}_5\text{O}_6\text{S}^-) \cdot 2(\text{H}_2\text{O})$ was obtained from the reaction of 3-carboxy-4-hydroxybenzenesulfonic acid (5-sulfosalicylic acid, 5-SSA) with MgCO_3 and the structure is reported here. In the structure of this compound (Fig. 1), the octahedral cationic Mg complex cations lie on crystallographic inversion centres $[\text{Mg}—\text{O}, 2.0396(17)–2.0664(19) \text{ \AA}]$. This complex is isomorphous with other divalent first transition metal–5-SSA complexes with the same basic dihydrate formula $[\text{M}(\text{H}_2\text{O})_6] 2(5\text{-SSA}^-) \cdot 2(\text{H}_2\text{O})$, $[\text{M} = \text{Mn}$ (Ma *et al.*, 2003a); Co (Abdelhak *et al.*, 2005); Cu (Ma *et al.*, 2003d)]. These complexes are also similar to the tetrahydrate analogues $\{[\text{M}(\text{H}_2\text{O})_6] 2(5\text{-SSA}^-) \cdot 4(\text{H}_2\text{O})\}$, having triclinic unit cells with comparable cell parameters *e.g.* Co^{II} (Ma *et al.*, 2003b) and Ni (Ma *et al.*, 2003c) and Zn (Ma *et al.*, 2003e).

The coordinated water molecules are involved in a number of $\text{O}—\text{H}\cdots\text{O}$ hydrogen-bonding interactions with sulfonate and carboxylate O acceptors of the uncoordinated 5-SSA monoanions and the water molecules of solvation (Table 1) and together with a carboxylic acid $\text{O}—\text{H}\cdots\text{O}_{\text{sulfonate}}$ hydrogen bond form a three-dimensional structure (Fig. 2). In the anion there is the intramolecular cyclic phenol $\text{O}—\text{H}\cdots\text{O}_{\text{carboxyl}}$ hydrogen bond which is invariably present in this monoanion (Ma *et al.*, 2003a). One H of one of the coordinated water molecules (H22W) has no reasonable acceptor in the structure.

Experimental

The title compound was synthesized by heating 218 mg (1 mmol) of 3-carboxy-4-hydroxybenzenesulfonic acid (5-sulfosalicylic acid) with an excess of MgCO_3 in 50 ml of 1:1 ethanol–water under reflux for 10 min. After completion of the reaction, the unreacted MgCO_3 was removed by filtration and the solution was allowed evaporate to incipient dryness at room temperature, giving small colourless prisms of the title compound from which a specimen was cleaved for the X-ray analysis.

Refinement

Hydrogen atoms involved in hydrogen-bonding interactions were located by difference methods and their positional and isotropic displacement parameters were refined. Other H-atoms were included in the refinement at calculated positions $[\text{C}—\text{H} = 0.93 \text{ \AA}]$ and with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$, using a riding-model approximation.

Figures

Fig. 1. Molecular configuration and atom naming scheme for the cation, anion and water species in the asymmetric unit of the title compound. Inter-species hydrogen bonds are shown as dashed lines and displacement ellipsoids are drawn at the 50% probability level. For symmetry code (i): $-x, -y, -z$.

Fig. 2. The hydrogen-bonding interactions in the title compound viewed down *a*. For symmetry codes, see Table 1.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.032$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.086$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.14$	$w = 1/[\sigma^2(F_o^2) + (0.0388P)^2 + 0.10P]$
2899 reflections	where $P = (F_o^2 + 2F_c^2)/3$
209 parameters	$(\Delta/\sigma)_{\text{max}} = 0.001$
	$\Delta\rho_{\text{max}} = 0.34 \text{ e \AA}^{-3}$

0 restraints

$$\Delta\rho_{\min} = -0.43 \text{ e } \text{\AA}^{-3}$$

Special details

Geometry. Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
